Evidence-based policymaking — quantitative analyses for smart specialisation — identifying the economic and innovative potential — definitions & examples

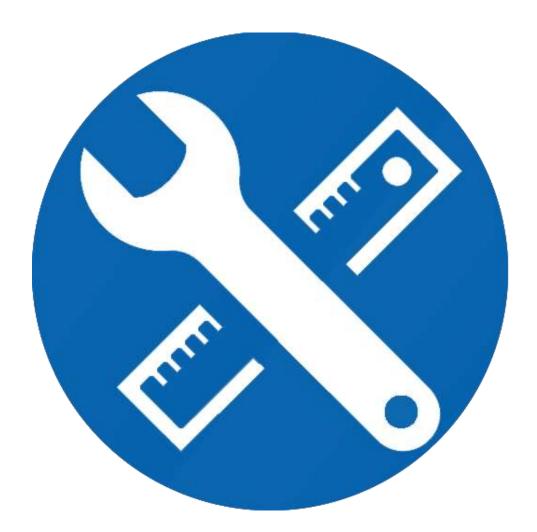

Hugo Hollanders & Iris Merkelbach

Maastricht University

Technical S3 Workshop Eastern Partnership Countries
9 December 2020

Mapping economic and innovation potential: definitions & technical details

General remarks

- There is not one "JRC methodology"
- There are recommendations for data to be used and sources
- But depending on data availability, customized methodologies are required for different countries/regions

Mapping of economic potential

Remember: selection criteria

1. Critical mass

 Absolute size of an industry matters, too small industries have a small economic impact

2. Degree of specialisation

- Measures if, in relative terms, an industry is more important for (present in) the region

3. Average wages

Focus on industries with above average wages

4. Change over time

Growing industries are more likely to drive economic transformation

Collect Economic data

- Request detailed industry-level data from National Statistics Office at country and/or regional level:
 - Time series data for:
 - Number of enterprises
 - Persons employed / Employees
 - Turnover / Value added
 - Wages
- Example of data source: Structural Business Statistics
- Caveat: does not cover Agricultural sector and parts of the Public sector => need for additional data

Calculate Critical mass (CM)

Calculated as: $CM_i = e_i / e$

e_i: employment (number of employees or number of employed persons) in industry *i* in region

e: total employment in region

Example:

- Employment in Textiles in region i = 2,000
- Total employment in region i = 50,000
- Critical mass: 4% (2,000 / 50,000)

Calculate Degree of specialisation

Calculated as: $LQ_i = (e_i / e) / (E_i / E)$

LQ_i: Location Quotient for industry *i* in region

e_i: employment in industry *i* in region

e: total employment in region

E_i: employment in industry *i* in country

E: total employment in country

LQ_i > 1: above average degree of specialisation

Degree of specialisation - example

$$LQ_i = (e_i / e) / (E_i / E)$$

e_i: employment in Textiles in region = 2,000

e: total employment in region = 50,000

e_i / e : employment share in region = 4%

 E_i : employment in Textiles in country = 25,000

E: total employment in country = 1,000,000

 E_i / E : employment share in country = 2.5%

Degree of specialisation (4% / 2.5%) = 1.6

Calculate Average wages per employee

- Relative to <u>average wages in region</u>
 Wages per employee in industry *i* divided by wages per employee for all industries in region (w_i / e_i) / (w / e) (> threshold)
- Relative to <u>average wages in industry</u>
 Wages per employee in industry *i* divided by wages per employee in same industry for all regions (country)
 (w_i / e_i) / (W_i / E_i) (> threshold)

Average wages per employee - example

Average wages in industry *i* : 3,000

Average wages in region: 2,500

Average wages relative to region (index): 120

Average wages in industry *i* : 3,000

Average wages in industry *i* in country : 4,000

Average wages relative to national industry (index): 75

Decide on cut-off values for selection criteria

Option 1: Using averages for multiple years:

Degree of specialisation (LQ) > X & Relative size > Y & Wages relative to region > Z_1 & Wages relative to industry > Z_2

Option 2: for at least X out of Y years AND for the average over the whole period

Results

- Applying the selection criteria will result in a list of industries that pass all criteria and are therefore defined as having a static or current economic potential
- Number of selected industries can be adjusted:
 - Using stricter criteria will lower this number
 - Relaxing the criteria will increase this number

Several options for dynamic analysis

- Calculate annual changes for 2012-2013, 2013-2014, 2014-2015, 2015-2016, 2016-2017, 2017-2018 and average annual change for 2012-2018 for every industry in region and country
 - Average annual change relative to region for 2012-2018 needs to be positive & Annual change relative to region needs to be positive for at least X out of Y two-year periods
 - 2. Average annual change relative to industry for 2012-2018 needs to be positive & Annual change relative to national industry needs to be positive for at least X out of Y two-year periods

Dynamic analysis – alternative

- An industry is identified as having a dynamic economic potential if it fulfils all of the following criteria:
 - (Statistically) Significant increase over time in the number of employees
 - (Statistically) Significant increase over time in average wages
- Changes over time for the number of employees and average wages are estimated using the slope of a linear regression using two-year averages for the whole 2012-2018 period

Results

- Applying the selection criteria will result in a list of industries that pass all criteria and are therefore defined as having a dynamic economic potential
- Number of selected industries can be adjusted by either relaxing or tightening the selection criteria

Combining results

- Static and dynamic results can be combined to derive 3 types of industries with an economic potential:
 - Static and dynamic
 - Static only
 - Dynamic only

Mapping of innovation potential

Collect Innovation data from innovation survey

- Innovation surveys collect data on innovations and innovation activities directly from enterprises using a questionnaire including a wide range of questions
- No other data sources can provide the same in-depth data on innovation
 - R&D data are too limited as the majority of enterprises innovate without performing any R&D
 - Patents, trademarks and designs only capture a small part of the outcomes of enterprises' innovation activities

How to define an innovative enterprise

- An enterprise that has introduced at least:
 - A product innovation
 - A process innovation
 - A marketing innovation
 - An organisational innovation

Different options to identify innovation potential

- At least X number of enterprises should be an innovator
- Degree of specialisation (either comparing region to country or comparing country to other countries) should be above Y
- Used for Moldova study (2017)

Alternative for innovation potential

- At least X number of enterprises should be an innovator
- Critical mass (e.g. share of innovative enterprises in industry out of all innovative enterprises in region) should be above Y
- Used for Ukrainian regions study (2019)

Alternative for innovation potential

- Define new indicator measuring innovation intensity as the share of enterprises that introduced at least two types of innovation
- Share of enterprises with at least one innovation: above average share for region
- Share of enterprises with at least two innovations ('high-innovation intensive'): above average share for region
- Used for Imereti study (2020)

Issues

- Availability of innovation survey data:
 - Not all countries have implemented an innovation survey
 - Innovation surveys usually do not cover all industries but only those that are considered to be more innovative
 - National sample size might be too small to calculate data at NACE 3-digit level for countries
 - National sample size might be too small to calculate data at regional level (in particular for more detailed NACE levels)

Combine results for industries (example)

NACE	Industry	Employ ment - Static	Employ ment – Dyna- mic	Innova- tion	Econo- mic & Innova- tion
10.3	Processing and preserving of fruit and vegetables			X	
10.5	Manufacture of dairy products			Χ	
10.6	Manufacture of grain mill products, starches and starch products			X	
10.8	Manufacture of other food products		Χ	Χ	Χ
18.1	Printing and service activities related to printing	X		Х	Х
20.1	Manufacture of basic chemicals, fertilizers and nitrogen compounds, plastics and synthetic rubber in primary forms		X	X	X
20.3	Manufacture of paints, varnishes and similar coatings, printing ink and mastics		Х		
20.4	Manufacture of soap and detergents, cleaning and polishing preparations, perfumes and toilet preparations		Х	X	X
20.5	Manufacture of other chemical products		Χ		

Examples

Topic of this part of the presentation

 Highlight technical issues / potential problems in performing a mapping of the economic analysis of the Eastern Partnership countries

Issue

- (Non) Availability of data
- Database: UNIDO INDSTAT: 3-digit economic data for the Manufacturing sector

		AM	ΑZ	ВҮ	GE	MD	UA

325	Medical and dental instruments and supplies						
329	Other manufacturing n.e.c.						
331	Repair of fabricated metal products/machinery						
332	Installation of industrial machinery/equipment						

Data availability

- 3-digit data for 71 industries for Armenia,
 Azerbaijan and Ukraine
- Limited 3-digit data for Georgia (37 industries)
 and Moldova (13 industries)
- Insufficient 3-digit data for Belarus (only one 3-digit industry, other industries at 2-digit) => not included in analysis
- Industries with smallest common base are included in analysis for all countries, incl. 2-digit industries: e.g. NACE 20 combining 201, 202, 203

110	Other food products
120	Tobacco products
13	Manufacture of textiles
14	Manufacture of wearing apparel
15	Manufacture of leather and related products
16	Manufacture of wood and of products of wood
	and cork, except furniture; manufacture of articles
	of straw and plaiting materials
170	Wood products, cork, straw, plaiting materials
181	Printing and service activities related to printing
182	Reproduction of recorded media
19	Manufacture of coke and refined petroleum products
	10.000

Manufacture of chemicals and chemical products
Pharmaceuticals, medicinal chemicals, etc.
Manufacture of rubber and plastic products
Manufacture of other non-metallic mineral products
Manufacture of basic metals
Manufacture of fabricated metal products, except machinery and equipment
Manufacture of computer, electronic and optical products
Manufacture of electrical equipment
Manufacture of machinery and equipment n.e.c.
Manufacture of motor vehicles, trailers and semi- trailers
Manufacture of other transport equipment
Furniture
Other manufacturing
Repair and installation of machinery and equipment

Issue

- (Non) Availability of data
- Database: ORBIS => aggregation of individual firm-level data to NACE 3-digit

Unequal availability of ORBIS data

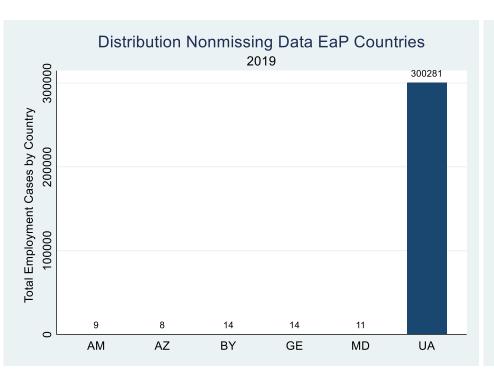

Findings:

 Highly unsymmetric distribution of available data among EaP countries

 Ukraine's data set contains the most values whereas other EaP countries have a limited number of values, most notable for 2018 and 2019

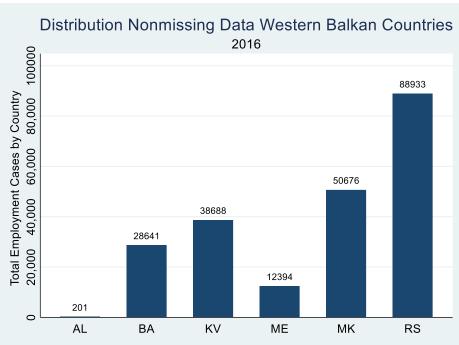

Distribution 2019

Distribution 2016

Possible solutions to address this issue

Product Classification (SITC) next to NACE data:

- Less time consuming
- Higher data validity
- More likely to reflect the economic structure of EaP countries

Concord SITC export data into NACE data:

- Leads to a richer NACE data base more suitable for carrying out various innovation analyses
 - Might be a temporary solution to the lack of data

Selection of benchmark (countries)

- For regions within countries: country
- For countries:
 - European Union
 - Neighbouring countries
 - Other ???

Degree of specialisation (Location Quotient)

Calculated as: $LQ_i = (e_i / e) / (E_i / E)$

LQ_i: Location Quotient for industry *i* in country

e_i: employment in industry *i* in country

e: total employment in country

E_i: employment in industry *i* in EaP aggregate

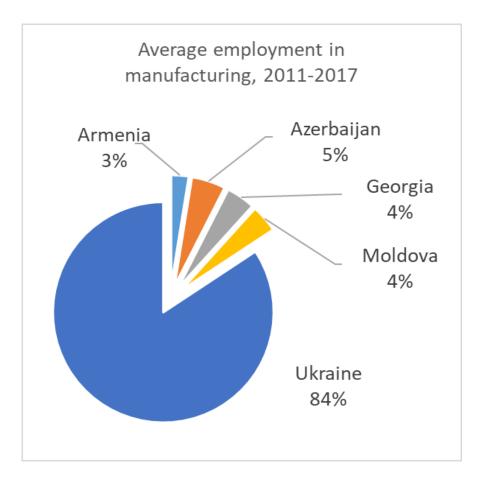

E: total employment in EaP aggregate

Issue

- For EaP countries: benchmark = aggregate or sum of EaP countries
- How to calculate this sum?
 - Weighted average (taking into account country size)?
 - Unweighted average?

Unequal size distribution for employment

INDSTAT database

 When using a weighted average, Ukraine would dominate the EaP total

 Alternative: use an unweighted average for employment shares

Weighted avg: no specialised industries in Ukraine

	EMPLOYMENT					EMPLOYMENT SHARE						SPECIALISATION

Comparison of results (# of selected industries)

	Weighted average	Unweighted average
Armenia	9	3
Azerbaijan	8	5
Georgia	8	4
Moldova	7	4
Ukraine	0	5

Difference in results due to differences in average EaP employment shares

Issue

- Selection of years
- If we have data for X years, when is an industry above the specialisation threshold:
 - For all X years individually
 - For a minimum of Y years
 - For the whole time period

Example for Georgia: which industries to select

Choice of selection criteria

- Number of identified/selected industries depends on threshold value of selection criteria
- E.g. a threshold of 1.5 for the degree of specialisation (Location Quotient) will result in a lower number of selected industries compared to a threshold of 1.25

		SPECIALISA	TION	1.5		1.25	SPECIALISAT	ΓΙΟΝ	1.25		1.25
		AR	AZ	GE	MD	UA	AR	AZ	GE	MD	UA
